

ARP® PRODUCT GUIDE FOR CHRYSLER GEN III HEMI

Highly respected fastener manufacturer ARP has compiled a handy Product Guide detailing all of the company's offerings that fit the popular new "Gen III" Chrysler Hemi engine. These high performance fasteners provide increased clamping force and an extra margin of safety not found in factory TTY (Torque-To-Yield) bolts. Additionally, ARP fasteners are engineered to be re-used, whereas the OEM bolts are yielded by design and should not be put back into service.

Chrysler's 5.7L, 6.1L and 6.4L "392" engines are addressed in the Gen III Product Guide, which includes critical internal engine components (head studs, main studs and rod bolts) as well as key driveline and accessory bolts. This includes a convenient Engine & Accessory Fastener Kit that contains polished stainless steel or black oxide finished 8740 chrome moly bolts for a dozen applications ranging from the intake system to the oil pan. They are available with both hex and 12-point heads.

ARP's Gen III Hemi Product Guide is available free for downloading and can be found on the company's website, www.ARP-bolts.com. A printed 128-page full-line catalog is also available upon request. Technical assistance can be obtained by calling 800-826-3045.
