Wiseco Introduces Pistons For Honda/Acura J32 & J35 Engines

The popular J32 and J35 engine found in many Honda and Acura vehicles from the turn of the century to date can have their power boosted significantly thanks to these new pistons from Wiseco. Forged from race-proven 2618 aluminum alloy, the pistons are engineered to withstand high combustion pressures from various power-adders (turbo, nitrous, etc.) and feature internal struts for extra strength. They have a 10.5:1 compression ratio.

In addition to the factory 89mm bore for the potent V-6 engines they are available in 89.25mm and 89.50mm oversized versions. The pistons come equipped with a set of Wiseco XX piston rings as well as a 22mm outer diameter wrist pin. Wiseco's highly regarded ArmorGlide® skirt coating helps reduce friction and increase power.

Pistons are forged in-house at Wiseco's Mentor, Ohio facility and precision machined using the latest in CNC technology. For additional information call Wiseco's tech team at 800-321-1364 or visit www.Wiseco.com.
