New "Outlaw" Power Valve From Nitrous Supply

While you'd think the bottle valve in a nitrous oxide system is a basic on/off deal, there are actually significant performance gains available through use of the Outlaw Power Valve developed by nitrous pioneer Mike Thermos and his team at Nitrous Supply.

High horsepower nitrous systems require a higher volume of N₂O and with its big .500" orifice, straight passageway design and 5/8" siphon tube the NS "Outlaw" Power Valve serves to optimize performance. Precision CNC-machined from billet aluminum and black anodized, the "Outlaw" Power Valve features a quick 1/4-turn activation that's far superior to conventional knob-actuated valves and lends itself to employing a remote shut-off cable for added safety.

Other important features include an AN-8 pressure relief fitting that facilitates routing the pressurized nitrous oxide out of the driver's compartment, plus dual 1/8 NPT gauge ports.

Nitrous Supply is a key resource for leading Pro Mod and other nitrous racers, as the firm offers a wide range of bottles, valves, solenoids, nozzles and jets. Located in Huntington Beach, CA, the company also offers services such as N₂O bottle refilling, system flow testing and manifold plumbing. Call 714-373-1986 or visit www.NitrousSupply.com for details.
